Ed

Spencer

sunny

Sandesh (client)

Meeting starts with goingover ethans dashboard prototype. Looks good, Sandesh then shows a different dashboard and talks us through different scenarios about weather apis.

Decided we will definitely use local systems to host project for initial deadline. And then the second deadline then we will introduce aws.

Now we have ethans code, sunny will transfer the ai data and incorporate this into ethans html.

Mr Shubas has now given Sandesh credentials for the aws account and will send it to us on the watsapp.

Is the Kaggle data able to be changed to remove numbers at the end to make it easier for sunny to use

Sandesh gave us examples of how the ai will predict and how it should be shown

H1 the next day

H7 next week

H14 fortnight

As well as giving examples of the weather api

In his example he also has his product list at the bottom of the page, displaying product, stock, 7 day forecast, how long this will last, status (how likely they are to run out), and how much to order.

Sunny to get a dataset to compare his ai to the new set.

Sunny question – when working on the model, what should be shown for the presentation.

　　　Show the model, the metrics and different apis

Client is haapy 😊

We will also start making people change the Trello and git hub to make sure everyone is getting the marks

Spencer to help interpret the logs with sunnys model.

Sunny going to use fast api

Spencer look into postman api testing

Yet to do literacy review - everyone find a few similar papers

Next meeting 22/12/25 5pm
