

11.03.26 meeting minutes

Edward

Sunny

Ethan

Spencer

Shubas

Sandesh

Edward begins final demonstration by initially showing the final cloud architecture to show the background around how it all runs.

Edward then goes onto aws to start instance and start the demonstration.

He talks about the reasoning of there being two instances, this being one being the main one used and the other being a backup in case the main one goes down.

Ethan then talks about his aspect of the model. Going through different parts of the models, such as the forecast engine, the inventory, what if scenarios.

Ethan demonstrated the what if scenarios, giving reasoning as to why the what if scenario is needed then goes on with tests such as more extreme weather and how this effects the models forecast. As well as allowing the user to use real world locations weather scenarios.

Shubas asks ethan to demonstrate how a user may go through and work the model. Ethan gives the demonstration with the test data and how the user would be a shop or a warehouse, and in the inventory tab explains that the sku's show the forecasts of expiry and sales forecasts.

Ethan then explains the tab of ML ops which shows the model, he explains this wont be used necessarily by the user but shows the accuracy of the model. He then goes on to talk about SHAP which he explains is the reasoning given by model as to why it has made these predictions

Shubas asks did we get to learn what we wanted to learn during the development stage

Sunny states he did during the training of the model describing his journey of choosing which model to choose.

Ethan enjoyed working on a larger scale and enjoyed the different stages in working in a team. Also goes on to talk about linking with aws

Spencer enjoyed the testing aspects as well as enjoyed the in depth research into the legislation that is required for a project like this.

Ed felt he really has an understanding of the aws systems.

Sunny asks what we could do differently?

Shubas explains we could have potentially given more frequent updates and such.
